Upon reflecting on the design and implementation process, I found that my initial UML diagram was quite close to the final system, though there were a few areas I overlooked. For instance, I initially missed clearly defining the relationship between the Alchemy Factory and the Potion class, as well as how the factory dynamically chooses different crafting algorithms.. These challenges highlighted the importance of iterating through designs and learning from mistakes. The more I practice, the better I get at recognizing patterns and refining my approach to software design.
